EASTERN EUROPEAN MANPOWER AND  
PHYSICAL PRODUCTION, 1950-1955

This report was prepared as a part of the US contribution to a NATO study comparing economic trends in the Free World and the Sino-Soviet bloc. Other parts of the US contribution concerned with East Europe are: E-5, Eastern European GNP, 1950-1955 and E-6, Eastern European GNP, 1955-1975.

Eastern European Manpower and  
Physical Production, 1950-1955

A. Population and Labor Force of the European Satellites

The total population of the seven European Satellites increased almost 4.9 percent between 1950 and 1955. Widely divergent trends were experienced among the countries, however. In Albania, for example, the total population increased 15 percent, while in East Germany the total population declined. Among the other countries the range was from a 10 percent increase in Poland to a 4.4 percent increase in Bulgaria.

Of a total of 94.5 million persons in 1955, almost 48 percent resided in Poland and East Germany, with the remaining 52 percent distributed among the five other Satellites.

The labor force of the Satellite countries was about 48 million persons in 1955. This represented an increase of 7.1 percent over 1950. Changes in the labor force experienced by the individual Satellites ranged from an increase of 13 percent in Poland to a decline of 6 percent in East Germany.

Without exception, the agricultural labor force declined relative to the total in the European Satellites from 1950 to 1955. In fact, with the exception of Poland and Bulgaria, the Satellites experienced a decline in the number of persons employed in agriculture. On the other hand, the non-agricultural labor force increased in all countries except East Germany and the average for the Satellites was almost 17 percent for the five year period.

The estimates of population and labor force presented in this report were prepared, where possible, from official data. The agricultural labor force is so defined as to exclude workers in forestry and fishing. These categories are included in the non-agricultural labor force.

B. Agricultural Production in the European Satellites

Three Satellites; Poland, Bulgaria and Rumania, appear to have achieved pre-war levels of agricultural production. Czechoslovakia, East Germany and Hungary, however, have not achieved the pre-war production levels. For all Satellites the index of agricultural production in 1955 was above the 1950 level.

The estimates of the production of selected agricultural products presented in this report were derived, where possible, from official statements. In some cases, conflicting official claims existed. In these instances, estimates were made which, in general, conform to the trends indicated by the official figures.

C. Industrial Production in the European Satellites

Without exception, the European Satellites achieved a substantial increase in industrial production from 1950 to 1955. Reflecting the scale of priorities introduced by Communism, emphasis was placed upon the growth of heavy industry and its supporting sectors in the economy light industry, a residual claimant on resources, grew much more slowly.

As in the case of the estimates of agricultural production, the estimates of the production of industrial commodities proceed, where possible, from official statements. In the case of differing data from official sources, estimates were made which conform to the trends indicated by the official figures.
